

Signal-to-Action Tester Guide

One signal, one mission, one governed outcome.

TESTER GUIDE

Purpose — A self-guided path that lets a new visitor understand and validate the complete VentureOS Curefoods story — from signal to governed outcome — without a live walkthrough.

Canonical URL — <https://ventureos-signal-to-action-agent.vercel.app>

Estimated completion — about 20 minutes

Suggested browser — Latest Chrome, Edge, or Safari

Screenshots — captured from the canonical production application (validated runtime baseline)

• Product overview

A self-guided path that lets a new visitor understand and validate the complete VentureOS Curefoods story — from signal to governed outcome — without a live walkthrough.

- Account **Curefoods** (VOS-CUREFOODS) · Mission M-RENEWAL-1 · Recommendation REC-M-RENEWAL-1
- Template renewal-risk-parallel-v1 · Audit reference audit://M-RENEWAL-1/REC-M-RENEWAL-1
- System outcome — “Governed work prepared successfully.” · Business outcome — “Awaiting external response.”
- Deterministic policy is the final authority; NVIDIA Nemotron is grounded narrative only and never selects, approves, or executes.

1 Before you begin

Purpose. Set expectations so you can test the product honestly and safely.

- VentureOS is an Enterprise AI Workforce Platform; Signal-to-Action Agent is the current flagship experience.
- The hosted scenario is a deterministic governed demo centred on Curefoods.
- The journey uses one canonical governed mission — no real email is sent, no real CRM task is created, and no real risk record is written.
- Manager Coaching state is presentation-local; Executive and Operations are read-only Production-Partial projections.
- Guardrails Lab evaluates curated scenarios and does not intercept real Production traffic.

What to do & expect

1. Open the canonical URL in a fresh browser session: <https://ventureos-signal-to-action-agent.vercel.app>

Expect: The VentureOS landing experience loads with no error banner and no login wall.

EXPECTED RESULT

- Canonical URL: <https://ventureos-signal-to-action-agent.vercel.app>
- Suggested browser: Latest Chrome, Edge, or Safari
- Suggested viewport: 1440px desktop; responsive to tablet and mobile
- Estimated duration: about 20 minutes

FAILURE INDICATORS

- A login wall
- A backend error banner
- A blank page

Truth note. This is a deterministic governed demo. Nothing you do here sends real email, changes a real CRM, or writes a real risk record.

2 Understand the product in two minutes

Purpose. Grasp the VentureOS story before touching the governed flow.

Route: /

- Signals are fragmented across CRMs, product usage, and support.
- VentureOS turns signals into governed decisions — evidence comes before confidence.
- One recommendation is surfaced; approval comes before action; execution stays controlled; all activity is auditable.

What to do & expect

1. Open the canonical URL and confirm the hero renders.

Expect: The product hero renders with no blank page and no backend error.

2. Confirm the page states that human approval is required.

Expect: A human-approval assurance is visible.

3. Confirm the page indicates the active data source truthfully.

Expect: The active CRM / data source is described honestly, not overstated.

4. Click Explore VentureOS (or See how it works).

Expect: You are taken into the product story or walkthrough with no broken CTA.

EXPECTED RESULT

- No blank page, backend error banner, or local backend address message.
- No pre-release branch label, secret, or internal URL.
- No broken CTA.

FAILURE INDICATORS

- Blank hero
- Backend error banner
- local backend address text
- pre-release branch label
- Broken CTA

Truth note. The landing experience is Production.

SOVEREIGN AGENTIC AI · TRACK A

Turn customer signals into governed action.

Signal-to-Action Agent continuously monitors your customer portfolio, detects risk and opportunity, and recommends governed next-best actions — before revenue is lost.

Enter Command Center →

See how it works

Explore VentureOS

Human-approved Evidence-backed NVIDIA-ready runtime

 99 ACCOUNTS	 108 SIGNALS	 6 AI AGENTS	 10 RECOMMENDATIONS	 Required HUMAN APPROVAL	 HubSpot CRM WRITEBACK
---------------------------	---------------------------	---------------------------	----------------------------------	---------------------------------------	-------------------------------------

WHY IT'S DIFFERENT

Beyond a system of record

A CRM stores what happened. Signal-to-Action understands it, reasons over it, and tells you what to do — with a human in the loop.

TRADITIONAL CRM Stores data

- × Static records and dashboards
- × Manual review, account by account
- × Reactive — you find the signal
- × No reasoning, no recommended action

SIGNAL-TO-ACTION Understands & acts on data

- ✓ Understands fragmented signals
- ✓ Reasons over evidence with confidence
- ✓ Recommends the next-best action
- ✓ Human approves, then writes back to CRM

HOW IT WORKS

From signal to governed action

Every recommendation travels the same auditable path — no autonomous black box.

CAPABILITIES

Built for executive decisions

Everything an enterprise needs to act on its portfolio with confidence and control.

Executive Command Center

A morning brief that tells you what to do today — not a wall of metrics.

Portfolio Intelligence

Risk versus opportunity across every account, ranked and explained.

Decision Ledger

Every recommendation traced to its evidence, confidence and caveats.

Governed AI

Confidence scoring and caveats — nothing acts without sufficient evidence.

Human Approval

A person approves, edits or rejects before any action is taken.

CRM Synchronization

Approved actions write back to HubSpot as tasks and notes.

Your portfolio review is ready.

Step into the Command Center to see the accounts that need attention today — and the recommended next move for each.

Enter Command Center →

Open Workspace

Active source: HubSpot test CRM - 100% governed, human-approved workflow

Production landing — the product hero and governance assurances.

3 Review the full product walkthrough

Purpose. See the same canonical Curefoods journey told end to end, with product evidence.

Route: `/walkthrough`

- The walkthrough is the narrative guide to the same canonical Curefoods journey.
- Embedded screenshots are product evidence, not decorative mockups.
- Clicking an image expands it; Escape or the close control dismisses it.

What to do & expect

1. Open `/walkthrough` and scroll through all stages.

Expect: Every stage renders with its embedded image loaded.

2. Open at least two screenshots, then close the lightbox with Escape.

Expect: The lightbox opens and closes cleanly with no layout shift.

3. Use one CTA to enter the product journey.

Expect: The CTA resolves into the real product experience.

EXPECTED RESULT

- All stages render and all embedded images load.
- Captions match the stage; status labels remain truthful.
- The lightbox opens and closes; there is no broken image.

FAILURE INDICATORS

- Missing stage
- Broken image
- Caption/stage mismatch
- Lightbox will not close

Truth note. Status labels in the walkthrough (Production, Production-Partial, Guided Demo, Guardrails Lab, Roadmap) are truthful and must remain visible.

PRODUCT WALKTHROUGH · 13 STAGES

From signal to governed action — the whole VentureOS story, in order.

Follow one governed Curefoods renewal mission end to end. Every stage answers the same questions: what happened, why it matters, what the AI did, what deterministic policy did, what the human controlled, what evidence proves it, and what remains unknown. Nothing here sends email, changes a CRM, or writes risk — execution is simulated and honestly labelled.

1 PRODUCT CONTEXT

Fragmented signals do not become governed action.

Enterprise customer information lives in disconnected systems, and recommendations rarely carry the traceability and approval an enterprise needs before acting.

- What happened: Customer information is fragmented across CRMs, product usage, and support — and disconnected from execution.
- Why it matters: Without traceability and a human approval gate, teams cannot trust an AI recommendation enough to act on it.
- What AI did: Nothing yet — this stage frames the enterprise problem VentureOS is built to solve.
- What deterministic policy did: Establishes the operating principle: every recommendation must be evidence-backed, governed, and human-approved before any action.
- What the human controlled: The human defines the governed workflow and remains the approver of any action.
- What remains unknown: Which specific account most needs attention today — answered next.

EVIDENCE

- Signals originate in separate systems (CRM, usage, support).
- Recommendations are often disconnected from execution and audit.
- Enterprise teams require traceability plus explicit approval.

2 PRODUCTION

Today's priority: protect the Curefoods renewal.

Curefoods surfaces as today's canonical mission — a renewal-protection scenario, presented honestly as a deterministic governed demo, not live customer CRM truth.

- What happened: Curefoods (VOS-CUREFOODS) becomes the canonical mission M-RENEWAL-1 under template renewal-risk-parallel-v1.
- Why it matters: One clear priority replaces a noisy list — the seller starts the day on the highest-value governed action.
- What AI did: Composes the mission narrative and 'why now' framing; it does not invent the priority or the evidence.
- What deterministic policy did: Deterministic ranking/selection make Curefoods the canonical mission; the demo mission is labelled truthfully.
- What the human controlled: The seller chooses whether to open the governed mission.
- What remains unknown: Whether the same identity carries into Mission Control — verified next.

EVIDENCE

- Account: Curefoods (VOS-CUREFOODS)
- Mission: Renewal protection · why now
- Label: Deterministic governed demo mission
- Not claimed as live customer CRM truth.

Open Today's Mission →

TODAY'S PRIORITY

Curefoods

Renewal protection mission

WHY NOW

Renewal risk has been identified from verified account-health, renewal-timeline and usage-trend evidence.

Governed mission ready for review

Deterministic governed demo mission

Open governed mission

Today's Mission surfaces Curefoods as the canonical governed demo mission.

3 PRODUCTION

The same mission continues into Mission Control.

Opening the governed mission carries the exact same account, mission, and recommendation forward — nothing is re-selected or changed.

- What happened: Mission Control resolves the same Curefoods account, mission M-RENEWAL-1, and recommendation REC-M-RENEWAL-1.
- Why it matters: Continuity is the strongest trust signal: there is one shared source of truth, not a second one created downstream.
- What AI did: Presents the continued mission; it does not fork or duplicate the mission truth.
- What deterministic policy did: Guarantees identity continuity — the same canonical identifiers, no duplicate mission or recommendation.
- What the human controlled: The human navigates between surfaces; the mission identity stays fixed.
- What remains unknown: Whether the recommendation is backed by real evidence — shown next.

EVIDENCE

- Same account: Curefoods
- Same mission: M-RENEWAL-1
- Same recommendation: REC-M-RENEWAL-1
- Continuity cue visible · nothing re-selected.

Open Mission Control →

The same governed mission, read only by Seller, Executive and Operations.

4

PRODUCTION

Verified evidence supports the recommendation.

Account health, renewal timeline, and usage trend are presented with explicit evidence references and a 3-of-3 verification.

- What happened: Evidence is assembled and verified (3 of 3) before the recommendation is trusted.
- Why it matters: The recommendation rests on checkable evidence, not on fabricated model claims.
- What AI did: Explains the evidence in readable language; it does not fabricate the underlying facts.
- What deterministic policy did: Requires evidence references and verification before a recommendation can proceed.
- What the human controlled: The human can inspect every evidence reference behind the recommendation.
- What remains unknown: How the explanation is grounded — the NVIDIA stage explains this.

EVIDENCE

- Account health · renewal timeline · usage trend
- Evidence references present
- Verification 3 of 3
- Evidence is not fabricated by the LLM.

5

PRODUCTION

NVIDIA grounds the explanation — but never decides.

A live NVIDIA NIM run (nvidia/nvidia-nemotron-nano-9b-v2) produces a grounded explanation with evidence references; deterministic VentureOS systems remain authoritative.

- What happened: Live path: provider=nim, model=nvidia/nvidia-nemotron-nano-9b-v2, grounded=true, fallbackUsed=false, with evidence references.
- Why it matters: NVIDIA improves clarity of the explanation without ever selecting the account or approving/executing anything.
- What AI did: Enhances the explanation, grounded in the verified evidence.
- What deterministic policy did: Remains the authority for selection, approval, and execution; a truthful deterministic fallback is used if NIM is unavailable.
- What the human controlled: The human reads the grounded explanation before approving.
- What remains unknown: Whether the action proceeds — that requires human approval, next.

EVIDENCE

- provider=nim
- model=nvidia/nvidia-nemotron-nano-9b-v2
- grounded=true · fallbackUsed=false
- NVIDIA does not select, approve, or execute.

The grounded explanation cites 3 verified evidence sources; NVIDIA never decides.

6

PRODUCTION

A human must approve before anything executes.

The approval gate shows the exact action scope and requires an explicit two-step approval binding. The AI cannot approve its own action.

- What happened: Execution is blocked until a human completes the explicit two-step approval for the exact action scope.
- Why it matters: The approval gate is the enforceable boundary between recommendation and action.
- What AI did: Proposes the action scope; it cannot self-approve or bypass the gate.
- What deterministic policy did: Enforces mandatory approval and binds approval to the exact recommendation and action scope.
- What the human controlled: The human explicitly approves (or rejects) — nothing executes before that.
- What remains unknown: What execution looks like — it is intentionally simulated, next.

EVIDENCE

- Approval gate mandatory
- Exact action scope visible
- Two-step approval binding
- AI cannot approve its own action.

Human approval is mandatory before any action; the AI cannot self-approve.

7

PRODUCTION

Execution is intentionally simulated.

After approval, the email is drafted (not sent), the CRM task is proposed (not created), and the risk update is proposed (not written). Receipts are produced.

- What happened: The three actions are simulated; no external system is changed.
- Why it matters: The demo proves the governed pipeline end-to-end without touching real customer systems.
- What AI did: Drafts the artifacts (email copy, task, risk note) for human review.
- What deterministic policy did: Holds execution in simulation-only mode and records receipts for each simulated action.
- What the human controlled: The human approved the exact scope that is now simulated.
- What remains unknown: The customer's actual response — separated in the governed outcome, next.

EVIDENCE

- Email drafted, not sent
- CRM task proposed, not created
- Risk update proposed, not written
- Receipts produced.

After approval, all three actions are simulated in a controlled sandbox — receipts produced, nothing sent.

8

PRODUCTION

Governed work is complete — the customer outcome is not claimed.

The system outcome and business outcome are deliberately separated: "Governed work prepared successfully," versus "Awaiting external response."

- What happened: System outcome: Governed work prepared successfully. Business outcome: Awaiting external response.
- Why it matters: Separating system completion from business result prevents overclaiming a renewal that has not happened.
- What AI did: States the governed outcome in honest language; it claims no customer or revenue result.
- What deterministic policy did: Distinguishes governed completion from external business result and blocks unsupported outcome claims.
- What the human controlled: The human reads a truthful outcome, free of overclaim.
- What remains unknown: Whether the customer renews — genuinely unknown, and not asserted.

EVIDENCE

- System: Governed work prepared successfully.
- Business: Awaiting external response.
- No claimed renewal, revenue, or risk-reduction result.

Completed: system outcome "Governed work prepared successfully" is separated from business "Awaiting external response".

9

GUIDED DEMO

Manager Coaching: where should I intervene?

A manager-lens Guided Demo reads a deterministic post-completion snapshot of the same Curefoods mission and recommends one focused, 15-minute coaching intervention — read-only, with no authority to act.

- What happened: One seller needs attention; the deterministic recommendation is to coach the Curefoods renewal conversation.
- Why it matters: Coaching answers a different question — where to intervene — without creating a second source of truth.
- What AI did: Frames the coaching recommendation from the same mission evidence.
- What deterministic policy did: Keeps Manager read-only; same canonical mission, recommendation, and audit reference; no mutation of mission state.
- What the human controlled: The manager reviews and assigns a simulated intervention; nothing is notified or written.
- What remains unknown: The coaching's real-world effectiveness — not calculated or claimed.

EVIDENCE

- Same canonical mission — post-completion snapshot, not the live Mission Control session state
- 15-minute coaching intervention
- Simulated manager action · no notification · no CRM mutation
- Not an enterprise-persistent workflow.

Open Manager Coaching →

Manager Coaching reads a post-completion snapshot of the same mission to recommend one 15-minute intervention.

Guardrails: what the AI cannot do.

An isolated Guardrails Lab runs curated scenarios: safe requests are allowed, prompt injection and approval bypass are blocked, and sensitive-data requests are redacted. NVIDIA NemoGuard is telemetry only.

- ✔ What happened: Deterministic policy is the final decision on every scenario; NVIDIA classification is an additional, non-authoritative signal.
- ⦿ Why it matters: Proving what the AI cannot do — even when the classifier disagrees — is core to enterprise trust.
- 📦 What AI did: Provides NemoGuard classification telemetry; it never selects, approves, or executes.
- ✔ What deterministic policy did: Blocks injection and approval bypass, redacts sensitive data, and remains authoritative during provider outage.
- 🔗 What the human controlled: The reviewer inspects each decision and the deterministic rail that triggered it.
- ⦿ What remains unknown: Coverage is limited to curated scenarios; it is not a claim of total protection.

EVIDENCE

- Safe request allowed
- Prompt injection blocked · approval bypass blocked
- Sensitive-data request redacted
- Forced fallback: deterministic policy still applies. Curated scenarios only — not global Production interception.

[Open Guardrails Lab →](#)

NVIDIA NemoGuard is additional telemetry; the raw score is not a probability.

Executive and Operations read the same mission.

The same Curefoods mission is projected for different personas — an Executive read-only outcome and an Operations health/audit view — without any persona creating a second source of truth.

- ✔ What happened: One shared mission is viewed through role-specific projections.
- ⦿ Why it matters: Personas align on one governed truth rather than diverging into separate versions.
- 📦 What AI did: Renders role-appropriate summaries of the same mission.
- ✔ What deterministic policy did: Guarantees one shared mission truth across all persona projections.
- 🔗 What the human controlled: Each persona reads the projection relevant to their role.
- ⦿ What remains unknown: Some persona projections are partial in this release.

EVIDENCE

- Same mission across personas
- Executive: read-only governed outcome
- Operations: health and audit
- No persona creates a second source of truth.

Audit proves what actually happened.

A canonical audit reference ties approval, simulation, and outcome into a valid chain: idempotent replay does not grow the ledger and there is no hidden execution.

- ✔ What happened: The canonical audit reference audit//M-RENEWAL-1/REC-M-RENEWAL-1 anchors a valid, replay-safe audit chain.
- ⦿ Why it matters: Auditability is what lets an enterprise trust that only the approved, simulated work occurred.
- 📦 What AI did: Nothing that mutates the audit — the AI has no write authority over the ledger.
- ✔ What deterministic policy did: Maintains a valid audit chain and idempotent replay with no duplicate ledger growth.
- 🔗 What the human controlled: The human can trace approval → simulation → outcome against the canonical reference.
- ⦿ What remains unknown: Nothing about the governed run — the chain is complete and checkable.

EVIDENCE

- Canonical audit reference: audit//M-RENEWAL-1/REC-M-RENEWAL-1
- Approval · simulation · outcome — chain valid
- Idempotent replay · no hidden execution

Product Walkthrough — the full narrative, all stages in order.

Walkthrough lightbox — click any evidence image to enlarge; Escape closes it.

4 Begin with Today's Mission

Purpose. Enter the canonical governed mission from the hosted priority.

Route: `/?view=mission`

- Account: Curefoods · VentureOS account ID: VOS-CUREFOODS
- Mission: M-RENEWAL-1 · Recommendation: REC-M-RENEWAL-1
- Template: renewal-risk-parallel-v1
- Audit reference: audit://M-RENEWAL-1/REC-M-RENEWAL-1

What to do & expect

1. Open Today's Mission and confirm Curefoods is the authoritative hosted demo entry.
Expect: Curefoods is presented as the canonical mission — not substituted by a provider mock.
2. Confirm the title Renewal protection mission and the truth label Deterministic governed demo mission.
Expect: Both the title and the deterministic governed demo label are visible.
3. Click Open governed mission.
Expect: You are routed to `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

EXPECTED RESULT

- No Tessera substitution and no empty mission.
- No provider-mock replacement of the canonical journey.
- Curefoods remains authoritative whether the public root API is warm, cold, mock, or synthetic.

FAILURE INDICATORS

- Tessera or other account substituted
- Empty mission
- Provider-mock replacement
- local backend address error

Truth note. Today's Mission canonical hosted journey is Production.

Today's Mission — Curefoods renewal protection, the canonical hosted entry.

5 Confirm mission continuity

Purpose. Verify Mission Control is the same mission, not a second re-selected one.

Route: `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

- Identity resolution is deterministic.
- Continuity is preserved across account, mission, recommendation, template, and audit reference.

What to do & expect

1. Confirm Curefoods and mission M-RENEWAL-1.

Expect: The same account and mission carry over from Today's Mission.

2. **Confirm the continuity cue and that nothing was re-selected.**

Expect: A continuity cue indicates the same mission; there is no re-selection step.

3. **Confirm the shared application navigation remains available.**

Expect: Shell navigation is present and functional.

EXPECTED RESULT

- Today's Mission and Mission Control describe the same mission.
- No identity mismatch, no duplicate shell, and no broken navigation.

FAILURE INDICATORS

- Identity mismatch
- Duplicate shell
- Broken navigation
- A second re-selected mission

Truth note. The Mission Control governed flow is Production.

MISSION CONTROL · RENEWAL RISK

Awaiting approval

Curefoods

The verified renewal mission is ready for your approval. No action has run.

technical evidence

Mission Control — awaiting approval; verification 3/3 precedes approval; actions proposed, not sent.

6 Review the signal and evidence

Purpose. Confirm evidence precedes the recommendation and confidence wording is honest.

Route: /mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission

- Mission Control sections include: What happened, Recommended renewal mission, Why this account is at risk, Confidence & evidence & provenance, Proposed actions, and Verification.
- Account-match confidence is identity confidence — not renewal probability.

What to do & expect

1. Review the signal narrative.

Expect: The signal is described before any recommendation is asserted.

2. Confirm three verified evidence sources: account health, renewal timeline, usage trend.

Expect: All three evidence sources are present and verified.

3. Confirm governance checks are 3 of 3, then expand technical evidence.

Expect: Governance shows 3/3; technical evidence expands with provenance visible.

EXPECTED RESULT

- Evidence precedes the recommendation and provenance is visible.
- Unsupported claims are absent and confidence wording is honest.
- The recommendation is not portrayed as autonomous execution.

FAILURE INDICATORS

- Recommendation shown before evidence
- Confidence framed as renewal probability
- Unsupported claim

Truth note. Account-match confidence describes identity confidence, not the probability that the renewal will be won.

Mission Control — awaiting approval; verification 3/3 precedes approval; actions proposed, not sent.

7 Understand NVIDIA's role

Purpose. See exactly what NVIDIA Nemotron does — and what it never does.

Route: /mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission

- NVIDIA Nemotron generates or supports the explanation layer and must remain grounded in supplied evidence.

- It does not select the mission, does not approve the mission, does not execute an action, and does not replace deterministic policy.
- It may fall back honestly when unavailable; intermittent deterministic fallback is an accepted resilience condition.

What to do & expect

1. Inspect the NVIDIA explanation evidence.

Expect: Provider nim and model nvidia/nvidia-nemotron-nano-9b-v2 are shown when live.

2. Confirm validation grounded and fallbackUsed false on a successful live run.

Expect: Validation reads grounded; fallbackUsed is false; grounded evidence references are shown.

3. If NVIDIA falls back, confirm it is labelled truthfully.

Expect: Fallback is labelled honestly and the product remains usable.

EXPECTED RESULT

- Live NVIDIA evidence is visible on at least one run.
- The product remains usable if NVIDIA falls back.
- No browser-to-NVIDIA request and no secret exposure.

FAILURE INDICATORS

- Browser-to-NVIDIA request
- Secret exposure
- Fallback bypasses policy or approval

Truth note. A fallback must never bypass policy or approval. NVIDIA integration is grounded narrative only.

technical evidence

Mission Control — awaiting approval; verification 3/3 precedes approval; actions proposed, not sent.

8 Verify approval is mandatory

Purpose. Prove nothing runs before an explicit human approval.

Route: `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

- The system may recommend and prepare actions, but only a human may approve.
- Approval is bound to the specific mission and proposed action; nothing runs before approval.

What to do & expect

1. Locate the Approval section and inspect what will be simulated and the technical approval binding.

Expect: Status is Awaiting approval; simulated execution has not run; the outcome says no action has run.

2. Confirm approve, request revision, and reject controls are available.

Expect: All three governed controls are present.

3. Click Approve and complete the second confirmation step.

Expect: Approval accepted; approved by Account owner (or equivalent) is shown; mission version stays bound; simulation becomes eligible.

EXPECTED RESULT

- Before approval: Awaiting approval, no simulated execution, and no action has run.
- After approval: approval accepted, actor displayed, mission version bound, simulation eligible.

FAILURE INDICATORS

- Any action runs before approval
- Approval not bound to the mission
- No second confirmation

Truth note. This is governed approval before simulation — not autonomous execution.

Approval accepted — mission completed; simulation becomes eligible only after human approval.

Purpose. Confirm three controlled actions run only in a sandbox, with receipts.

Route: `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

- Three controlled actions are produced: a customer email (drafted, not sent), a CRM task (proposed, not created), and a risk update (proposed, not written).
- Each action is labelled Simulated and completes in a sandbox with a receipt.

What to do & expect

1. Verify all three actions appear and each is labelled **Simulated**.

Expect: Three actions appear, all labelled Simulated.

2. Verify the before and after state and each receipt.

Expect: Receipts are shown: receipt://M-RENEWAL-1/email, receipt://M-RENEWAL-1/crm_task, receipt://M-RENEWAL-1/risk_update

3. Verify each action reads **Completed in sandbox**.

Expect: Each action reads Completed in sandbox; nothing real occurred.

EXPECTED RESULT

- No real email is sent, no CRM record is created, and no risk record is written.
- Three simulation receipts are visible.
- No mission action occurs before approval.

FAILURE INDICATORS

- A real email/CRM/risk action
- Missing receipt
- Action ran before approval

Truth note. Email drafting, CRM task proposal, and risk-update proposal are Simulated.

5. Governance checks

Done

2026-07-14T10:00:20Z

Verified: 3/3 checks passed.

technical evidence

6. Approval

Done

2026-07-14T10:00:35Z

Human approval captured.

technical evidence

7. Simulated actions

Done

2026-07-14T10:00:40Z

3 action(s) simulated — nothing left the sandbox.

technical evidence

8. Outcome checked

Done

2026-07-14T10:00:45Z

Simulated outcome verified against the approved action.

technical evidence

9. Mission closed

Done

2026-07-14T10:00:45Z

Mission closed for Curefoods.

technical evidence

Approval accepted — mission completed; simulation becomes eligible only after human approval.

Purpose. Understand why the system outcome and the business outcome differ.

Route: `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

- System outcome: "Governed work prepared successfully."
- Business outcome: "Awaiting external response."
- The product completed internal preparation; the customer has not responded, so no renewal is won and no revenue impact is claimed.

What to do & expect

1. Confirm mission state **Complete** and all three simulated action statements.

Expect: Mission state is Complete with three simulated action statements.

2. Confirm mission ID **M-RENEWAL-1** and audit reference **audit://M-RENEWAL-1/REC-M-RENEWAL-1**.

Expect: Mission ID and canonical audit reference are shown.

3. Confirm the business outcome remains awaiting external response.

Expect: Business outcome reads "Awaiting external response."

EXPECTED RESULT

- No unsupported success claim.
- No customer renewed, risk reduced to zero, or meeting booked statement.
- No fabricated customer behaviour.

FAILURE INDICATORS

- Customer renewed claim
- Risk reduced to zero claim
- Meeting booked claim
- Fabricated customer behaviour

Truth note. System outcome is exactly "Governed work prepared successfully."; business outcome is exactly "Awaiting external response.".

The screenshot displays the 'Signal-to-Action Agent' interface for a 'Governed renewal-risk mission'. The top navigation bar includes links for 'Morning Brief', 'Today's Mission', 'Mission Control' (active), 'Command Center', 'Workspace', and 'Trust & Governance'.

The main content area is divided into sections:

- CRM TASK: Stakeholder brief follow-up for Curefoods** (Simulated): Shows a 'BEFORE' state with 'No open renewal task' and an 'AFTER' state with 'CRM task proposed: brief exec sponsor on Curefoods renewal (not created)'. The receipt is `receipt://M-RENEWAL-1/crm_task`.
- RISK UPDATE: Risk update for Curefoods** (Simulated): Shows a 'BEFORE' state with 'Risk posture: at-risk (unactioned)' and an 'AFTER' state with 'Risk posture: at-risk (mitigation approved, simulated)'. The receipt is `receipt://M-RENEWAL-1/risk_update`.
- Outcome** (9): 'Where this mission stands now'. It states 'The renewal mission is complete. 3 actions were simulated: no email was sent and no CRM record was changed.' It lists three simulated actions: 'Renewal outreach drafted — not sent', 'CRM follow-up proposed — not created', and 'Risk update proposed — not written'. It shows the 'MISSION STATE' as 'Complete', the 'MISSION ID' as 'M-RENEWAL-1', and the 'AUDIT REFERENCE' as 'audit://M-RENEWAL-1/REC-M-RENEWAL-1'. A note at the bottom states: 'Every action ran in a controlled sandbox — nothing was sent and no record was changed.'
- Supporting customer context & audit** (18): 'One resolved account, and the full history'.

The 'SYSTEM OUTCOME' is 'Governed work prepared successfully.' and the 'BUSINESS OUTCOME' is 'Awaiting external response.'

Governed outcome — system outcome and business outcome are stated separately and honestly.

Purpose. See the same governed mission through Seller, Executive, and Operations.

Route: `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

- Seller sees the full governed mission.
- Executive — Production-Partial — receives a read-only summary.
- Operations — Production-Partial — sees audit status, simulated action count, and template.

What to do & expect

1. Verify all projections refer to Curefoods and M-RENEWAL-1.

Expect: Every projection references the same account and mission.

2. Verify Executive is a read-only summary and Operations shows audit status, action count, and template.

Expect: Executive is read-only; Operations shows audit/action/template details.

3. Verify no projection adds a new fact or executes an action.

Expect: No projection introduces a new fact or runs an action.

EXPECTED RESULT

- Shared state, shared audit reference, and shared governed outcome.
- No persona-specific contradiction.
- Production-Partial labels remain visible.

FAILURE INDICATORS

- Persona contradiction
- A projection adds a new fact
- A projection executes an action
- Missing Production-Partial label

Truth note. Executive and Operations projections are Production-Partial.

The screenshot displays the 'Signal-to-Action Agent' interface for a 'Governed renewal-risk mission'. The top navigation bar includes 'Morning Brief', 'Today's Mission', 'Mission Control' (active), 'Command Center', 'Workspace', and 'Trust & Governance'.

Mission Control Summary:

- MISSION STATE:** Complete
- MISSION ID:** M-RENEWAL-1
- AUDIT REFERENCE:** audit://M-RENEWAL-1/REC-M-RENEWAL-1

Every action ran in a controlled sandbox — nothing was sent and no record was changed.

Supporting customer context & audit (One resolved account, and the full history)

UNIFIED CUSTOMER CONTEXT:

- ACCOUNT:** Curefoods
- VENTUREOS ID:** VOS-CUREFOODS
- REVIEW TYPE:** Renewal risk review
- MISSION:** Renewal protection mission

THE SAME MISSION, READ BY EACH PERSONA

One governed Curefoods mission, projected read-only through each persona lens. Executive and Operations views are Production-Partial projections — they add no new facts and take no action.

PERSONA PROJECTIONS:

- SELLER:** Curefoods renewal — complete. Governed work prepared successfully. Awaiting external response. Human approval required before any action.
- EXECUTIVE (Production-Partial):** Curefoods renewal risk — one governed mission in progress. Governed work prepared successfully. Awaiting external response. Human approval required before any action. Execution simulated — no customer impact yet.
- OPERATIONS (Production-Partial):** Mission M-RENEWAL-1 • Curefoods • Complete. Audit chain valid. Simulated actions: 3. Template renewal-risk-parallel-v1.

Mission history (chain valid)

- 1. Signal received** (Done) 2026-07-14T09:59:45Z
Signal received for Curefoods.
↳ technical evidence
- 2. Customer identified** (Done) 2026-07-14T09:59:50Z
Resolved to canonical account Curefoods.
↳ technical evidence
- 3. Mission selected** (Done) 2026-07-14T09:59:55Z

Persona projections — Seller, Executive (Production-Partial) and Operations (Production-Partial) share one governed truth.

Purpose. Understand Manager Coaching as a post-mission Guided Scenario.

Route: `/manager`

- Manager Coaching is a post-mission Guided Scenario — a deterministic post-completion snapshot of the same canonical Curefoods mission.
- It is not reading the current browser Mission Control session and is not a CRM-backed manager identity.
- Its review state is browser-local; it does not change Mission Control, calculate coaching effectiveness, or claim revenue uplift or risk reduction.

What to do & expect

1. **Confirm the post-mission Guided Scenario label, the disclaimer, and canonical mission identity.**

Expect: The Guided Scenario label, disclaimer, and canonical identity are all visible.

2. **Click Review coaching guidance, then Assign simulated coaching intervention.**

Expect: State moves NOT REVIEWED → REVIEWED → SIMULATED INTERVENTION ASSIGNED.

3. **Refresh the page and confirm browser-local state persistence.**

Expect: The reviewed/assigned state persists locally in the browser.

EXPECTED RESULT

- No notification sent, no CRM record changed, and no mission state changed.
- No audit reference changed and Mission Control remains unaffected.

FAILURE INDICATORS

- Notification sent
- CRM changed
- Mission state changed
- Audit reference changed
- Manager disclaimer missing

Truth note. Manager Coaching is a Guided Scenario (Post-mission Guided Scenario). Manager interaction state is browser-local.

Post-mission Guided Scenario Manager Coaching Curefoods slice — not part of the Production persona navigation. DETERMINISTIC GOVERNED DEMO

This view demonstrates the manager experience after a completed simulated mission and is not reading the current browser mission state. Mission Control holds the live, session-local mission and may still be awaiting approval.

SALES MANAGER · WHERE SHOULD I INTERVENE?

One seller needs your attention today.

The Assigned seller on Curefoods has completed the governed renewal mission's internal preparation. The business outcome is still awaiting an external response — a focused coaching conversation is the next best step.

ASSIGNED SELLER · PRESENTATION-ONLY DEMO CONTEXT CUREFOODS M-RENEWAL-1

Coaching recommendation

FOCUS · RENEWAL_RECOVERY

Coach the Curefoods renewal conversation.

Why coach this now

- Renewal timeline requires preparation before the renewal decision.
- Usage trend needs discussion with the assigned seller.
- Governed work prepared successfully.
- Awaiting external response.

Suggested 15-minute intervention

15 MIN

What to discuss

- Review the usage-trend evidence behind the renewal mission.
- Confirm the renewal timeline and what preparation is still needed.
- Rehearse the customer conversation the seller will lead.
- Confirm the assigned seller understands the approved next steps for M-RENEWAL-1.

What good preparation looks like

- The seller can explain the renewal evidence in their own words.
- The seller has a clear, approved plan for the customer conversation.
- The manager and seller agree on what preparation remains before outreach.

Why it matters

- The governed mission has completed internal preparation, so the next step is human execution.
- A well-prepared conversation is the seller's responsibility — coaching sharpens it.

What remains unknown

- No external response exists yet — the business outcome is still pending.
- Whether the customer will engage is unknown and is not predicted here.

Mission continuity

NOT REVIEWED

Review coaching guidance

Assign simulated coaching intervention

Simulated manager intervention · No notification sent · No CRM record changed · No mission state changed

TRUTH & SIMULATION NOTICE

"Assigned seller" is presentation-only demo context — not a CRM-backed identity. The manager cannot approve, execute, or send — those remain the governed mission's gates.

Manager review state is simulated and stored only in this browser.

This is a deterministic governed demo; no coaching effectiveness is calculated. No revenue impact, adoption uplift, risk reduction, or customer response is claimed.

The governed mission, approval, simulation, audit, and ledger are never modified here.

Manager Coaching — a post-mission Guided Scenario; browser-local state; Mission Control is unaffected.

13 Review Guardrails Lab

Purpose. See how deterministic policy stays authoritative while NVIDIA adds telemetry.

Route: /guardrails

- VentureOS deterministic policy is authoritative; NVIDIA NeMoGuard JailbreakDetect is supplementary telemetry.
- The NVIDIA raw score is not a calibrated probability; NVIDIA does not select, approve, execute, or override the decision.
- Guardrails Lab uses curated auditable scenarios; it does not intercept real Production requests, appends no ledger event, and references the canonical audit record read-only.

What to do & expect

1. Run the safe grounded request.

Expect: Allowed, zero deterministic findings, no action executed.

2. Run prompt injection, unsupported business claim, and skip-approval scenarios.

Expect: Each is Blocked, with named deterministic findings (instruction conflict, approval bypass, execution request, unsupported claim).

3. Run the sensitive-data and account-substitution scenarios.

Expect: Sensitive data is Redacted; account substitution is Blocked with evidence-manipulation findings.

4. Toggle Live NVIDIA and Forced fallback.

Expect: Live: available true, fallbackUsed false, raw score shown honestly. Fallback: unavailable, fallbackUsed true, deterministic policy still applies, safe stays Allowed and unsafe stays Blocked/Redacted.

EXPECTED RESULT

- Deterministic policy is visibly the final authority; NVIDIA is supplementary telemetry.
- Audit projection: Referenced recommendation REC-M-RENEWAL-1; Referenced audit ref audit://M-RENEWAL-1/REC-M-RENEWAL-1.
- missionUnchanged true, auditRefUnchanged true, ledgerMutated false, actionExecuted false.

FAILURE INDICATORS

- NVIDIA presented as the decision
- Raw score shown as probability
- A safe scenario bricked under fallback
- Ledger mutated

Truth note. Deterministic policy is the final authority. NVIDIA NeMoGuard is supplementary telemetry and never selects, approves, executes, or overrides.

Guardrails — safe request Allowed; live NVIDIA telemetry is supplementary, not the decision.

GUARDRAILS LAB

DETERMINISTIC POLICY AUTHORITY

Guardrails Lab

GUARDRAILS LAB

What the agent cannot do — and how VentureOS proves it

Intelligence outages: customer safety

An attempt to assert a customer/renewal outcome that has not occurred.

Skip approval and send

An attempt to bypass mandatory human approval and execute an action.

Sensitive data request

An attempt to extract secrets, tokens, hidden prompts, or customer PII.

Account substitution / evidence manipulation

OPTIONAL

An attempt to swap the account and distort evidence while keeping the audit ref.

Execution request

Request tries to trigger a real external action (send / write / call).

Unsupported customer-response claim

Request tries to assert a customer outcome that has not occurred.

6 rails evaluated and clear

No stronger than the VentureOS safe reference prompt (VentureOS demo interpretation; not a probability).

Raw score is a model decision value, not a probability or confidence. Final authority: VentureOS deterministic policy.

Classifier mode

Live NVIDIA

Forced fallback

Forced fallback proves a provider outage never bypasses policy — testable without a real failure.

Action boundary

No action executed

Email not sent

CRM task not created

Truth & limitations

- Deterministic VentureOS policy is the sole authority for every decision here.
- NVIDIA JailbreakDetect is a supplementary classifier; its raw score is not a calibrated probability and its boolean may not fire on every attack.
- The score interpretation shown is VentureOS-defined for this demo, not supplied by NVIDIA.
- A provider outage never bypasses policy and never bricks a safe request (deterministic fallback).
- No Production request is intercepted, no mission or audit state changes, and no action is executed.
- Curefoods only. There is no free-form public prompt box — every request is a curated, auditable scenario.

Guardrails Lab · references audit//M-RENEWAL-1/REC-M-RENEWAL-1 read-only · return to Signal-to-Action Agent

Guardrails — sensitive-data request Redacted; no secret or PII is shown.

Guardrails — forced fallback; deterministic policy still applies and a safe scenario is not bricked.

14 Validate the audit chain and idempotency

Purpose. Confirm a stable audit chain and idempotent replay.

Route: `/mission-control?account=VOS-CUREFOODS&mission=M-RENEWAL-1&from=todays-mission`

- Every mission stage is represented in the history and the audit chain must be valid.
- Replaying the same approved mission must not create duplicate ledger growth.
- Narrative provider variability must not alter the deterministic audit result.

What to do & expect

1. Confirm all nine mission-history stages are Done after completion and the chain is valid.

Expect: Nine stages are Done and the chain reports valid.

2. **Confirm the audit reference audit://M-RENEWAL-1/REC-M-RENEWAL-1.**

Expect: The canonical audit reference is shown.

3. **Where an approved tester workflow exists, replay the mission and verify the same audit reference.**

Expect: Replay yields the same audit reference with no duplicate ledger growth.

EXPECTED RESULT

- Stable audit reference and stable ledger record count.
- Idempotent replay and no duplicate action execution.
- No change caused by live NVIDIA versus deterministic fallback.

FAILURE INDICATORS

- Invalid audit chain
- Duplicate ledger growth
- Audit reference changed by NVIDIA vs fallback

Truth note. Simulation and audit behaviour are Production; replay is idempotent.

Audit chain — nine mission stages Done; chain valid; replay stays idempotent.

15 Test navigation and resilience

Purpose. Confirm every route loads and recovers cleanly.

- Test direct route loading, browser refresh, back navigation, walkthrough image loading, lightbox Escape close, shell navigation, and all CTAs.

What to do & expect

1. **Load each expected route directly and refresh it.**

Expect: Every route returns 200 with no blank route and no repeated 5xx.

2. **Use back navigation and the lightbox Escape close.**

Expect: Back navigation works; the lightbox closes with Escape.

EXPECTED RESULT

- Routes: /, /walkthrough, /tester-guide, /manager, /guardrails, /mission-control, /?view=mission, /?view=command, /?view=workspace, /?view=trust.
- All return 200 with no broken image, local backend address reference, Preview-only label, or secret.
- No unintended Production action.

FAILURE INDICATORS

- Blank route
- Repeated 5xx
- Broken image
- local backend address reference
- Preview-only label

16 What is Production versus demonstration

Purpose. Read the truth table so you never over-claim what is live.

- Use the truth table below to classify each surface honestly.
- Voice and Digital Human are future presentation adapters and are not implemented.

What to do & expect

1. Read each row of the truth table.

Expect: You can classify every surface as Production, Production-Partial, Guided Demo, Simulated, Not-implemented, or Future.

EXPECTED RESULT

- Voice and Digital Human are not claimed as implemented.
- Simulated and Production-Partial surfaces are labelled honestly.

FAILURE INDICATORS

- Voice or Digital Human claimed as Production
- A simulated surface presented as real

Truth note. Do not claim Voice or Digital Human is implemented.

17 Defect reporting

Purpose. Capture the right evidence when something fails.

- For every defect, record severity (P0/P1/P2), route, date/time, browser/device, action taken, expected vs actual, and a screenshot.
- Also record whether refresh reproduces it, whether it blocks the canonical Curefoods journey, whether approval was bypassed, whether a real action occurred, whether audit identity changed, and whether a secret was visible.

What to do & expect

1. When something fails, capture a screenshot and complete the defect template.

Expect: A complete, reproducible defect record with severity and evidence.

EXPECTED RESULT

- Every defect has a severity, a route, and a screenshot.
- P0/P1/P2 severities follow the guidance below.

Purpose. Confirm you exercised and understood the whole journey.

- Tick each item once you have completed and understood it.

What to do & expect

1. Complete every checklist item, then submit feedback.

Expect: All items are checked and structured feedback is submitted.

EXPECTED RESULT

- All checklist items complete.
- Feedback submitted via the downloadable template.

T

Production versus demonstration — truth table

Production	Landing experience Today's Mission canonical hosted journey Mission Control governed flow Walkthrough route Tester Guide route (after approved promotion) Deterministic governance and approval Simulation and audit behaviour NVIDIA grounded narrative integration Guardrails Lab route (after approved promotion)
Production-Partial	Executive projection Operations projection
Guided Demo	Manager post-mission coaching scenario Browser-local Manager interaction state
Simulated	Email drafting CRM task proposal Risk-update proposal Manager intervention assignment
Not implemented as real external actions	Real email sending Real CRM record creation Real risk-record write Real customer response Real revenue outcome Real coaching-effectiveness measurement
Future	Persistent cross-route Manager state Production CRM identities and data External action execution after governance approval Voice and Digital Human presentation adapters

s

Severity guidance

P0 — CRITICAL — BLOCKS TRUST OR THE CANONICAL JOURNEY

- Canonical outage or a blank product route
- Approval bypass
- A non-simulated external action
- Invalid audit chain

- Identity mismatch
- Secret exposure
- Browser-to-NVIDIA or browser-to-Railway call
- Curefoods canonical mission replaced by mock/legacy state
- Truthful simulation labels missing

P1 — MAJOR — MATERIAL BUT NOT A TRUST BREACH

- Material navigation failure
- Inaccurate persona projection
- Broken walkthrough image
- Manager disclaimer missing
- Guardrails authority wording incorrect
- Deterministic fallback breaks a safe scenario
- An important expected state cannot be reached

P2 — MINOR — POLISH

- Cosmetic copy issue
- Spacing issue
- Minor mobile layout issue
- Non-blocking caption or icon issue

G Glossary

Signal

An observation from a source system (CRM, product usage, or support) that may warrant attention.

Mission	A governed unit of work created from a signal; here, the canonical Curefoods renewal-protection mission M-RENEWAL-1.
Recommendation	The evidence-backed next-best action proposed for a mission (REC-M-RENEWAL-1). It is never executed autonomously.
Deterministic governed demo	A hosted scenario whose outcome is fixed and policy-controlled — not live customer CRM truth.
Deterministic policy	The authoritative VentureOS rules that decide allow/block/redact. NVIDIA telemetry never overrides it.
Grounded narrative	An explanation produced by NVIDIA Nemotron that must stay tied to supplied evidence.
Fallback	A resilience state where NVIDIA is unavailable; deterministic policy still applies and a safe scenario is not bricked.
Simulated	An action that runs only in a sandbox and produces a receipt; no real email, CRM record, or risk record is created.
Receipt	A sandbox record of a simulated action, e.g. receipt://M-RENEWAL-1/email.
System outcome	What the product completed internally: Governed work prepared successfully.
Business outcome	The real-world result, which here remains Awaiting external response.
Audit reference	The canonical, stable identifier for the mission's governed record: audit://M-RENEWAL-1/REC-M-RENEWAL-1.
Production-Partial	A read-only projection (Executive, Operations) of the governed mission that adds no new facts.
Guided Scenario	A deterministic post-mission snapshot (Manager Coaching) with browser-local state; it changes no governed state.
